

Polar Orbiter Product Environmental Applications: Part 3

Kathleen Strabala
UPR Direct Broadcast Polar Orbiter
Workshop
27 April 2016

VIIRS Day/Night Band

- Visible wavelength available at night!
 - 735 m spatial resolution centered at about .7 microns
- What can now be seen at night?
 - Cities
 - Smoke, Dust, Ash
 - Low Clouds/Fog
 - Fires, Volcanoes (Lava)
 - Auroras
 - Lightning
- How much can be seen depends heavily on lunar illumination – Phase of moon, and rising setting times

VIIRS Day/Night Band

FIG. 1. Nighttime visible detection capabilities (a) with and (b) without lunar illumination.

Taken from: T., Miller, S. D., Turk, F. J., Schueler, C., Jullian, R., Deyo, S., Dills, P., and Wang, S., 2006: The NPOESS VIIRS Day/Night Visible Sensor, Bulletin Am. Met. Society, DOI:10.1175/BAMS-87-2-191, p. 191-199.

Currently Displaying Radiances

- Data spans 7 orders of magnitude
- We display it in terms of radiance units
 - Difficult to model the top of atmosphere incoming radiation from the moon, so no reflectance units in the Day/Night band VIIRS SDR file.
 - There is one as part of new release of CLAVRx cloud products.

Lunar Reflectance Model

Date: 2005 Sep 1 02:23:28 UT

2 Feb 1988 1600 UTC

Apogee: 406,395 km

Mean Distance = 384,401 km

Lunar Reflectance Model

VIIRS Fog Detection Capability

VIIRS in AWIPS Day/Night Band Mining Operations 8 April 2012

Another example of a Day/Night Band image from 08 April 2012 revealed a large number of natural gas flares and illuminated “man camps” associated with extensive drilling operations in the Bakken Shale Oil Field area of eastern Montana and western North Dakota.

TROPICAL STORM FLOSSIE DISCUSSION NUMBER 19

NWS CENTRAL PACIFIC HURRICANE CENTER HONOLULU HI EP062013

500 AM HST MON JUL 29 2013

THE CENTER OF FLOSSIE WAS HIDDEN BY HIGH CLOUDS MOST OF THE NIGHT BEFORE VIRS NIGHTTIME VISUAL SATELLITE IMAGERY REVEALED AN EXPOSED LOW LEVEL CIRCULATION CENTER FARTHER NORTH THAN EXPECTED. WE RE-BESTED THE 0600 UTC POSITION BASED ON THE VISIBLE DATA. SUBJECTIVE DVORAK ANALYSES CONTINUED SHOW CURRENT INTENSITIES OF 3.0 BUT SATELLITE LOOPS SUGGEST A RAPID WEAKENING TREND WITH THE LOW LEVEL CENTER PULLING AWAY FROM A SMALL AREA OF CONVECTION SOUTHEAST OF THE CENTER. IT IS LIKELY THAT CONTINUED NORTHWEST SHEAR WILL MAINTAIN THIS WEAKENING TREND.

THE TRACK HAS BEEN SHIFTED NORTH TO REFLECT THE RE-LOCATED CENTER. THE TRACK GUIDANCE SHIFTED FOLLOWING THE TRACK CHANGE AND WAS CONSISTENT WITH A NEW TRACK FARTHER TO THE NORTH. THE TRACK NOW SHOWS FLOSSIE PASSING OVER MAUI TODAY...OVER OAHU TONIGHT...THEN PASSING SOUTH OF KAUAI EARLY TUESDAY MORNING. WE EXPECT FLOSSIE TO WEAKEN STEADILY AS IT TRACKS WEST NORTHWEST AND DISSIPATE WITHIN 96 HOURS.

AREA FORECAST DISCUSSION

NATIONAL WEATHER SERVICE MARQUETTE MI

325 AM EST WED JAN 13 2016

.SHORT TERM...(TODAY AND TONIGHT)

.....THE MAIN FOCUS WILL BE ALONG THE CONVERGENCE ZONE SETUP OVER NORTHERN HOUGHTON COUNTY. OFFICIAL OBSERVATIONS ARE LIMITED OUT WEST...BUT PERSONAL WEATHER STATIONS DO INDICATE THE CONVERGENCE BAND IS LOCATED OVER NORTHERN HOUGHTON COUNTY AND IN LINE WITH THE RADAR NORTH OF MARQUETTE COUNTY. THIS IS A LITTLE FARTHER NORTH THAN ORIGINALLY EXPECTED WITH SOME OF THE 00Z MODEL RUNS (ALTHOUGH IT WAS ICKED UP ON OUR LOCAL 6Z WRF RUN). ***WAS HOPING TO GET A VISUAL CONFORMATION FROM THE VIIRS DAY/NIGHT BAND BEFORE FINALIZING THE FORECAST...BUT WILL HAVE TO WAIT A LITTLE LATER THIS MORNING FOR THAT.***

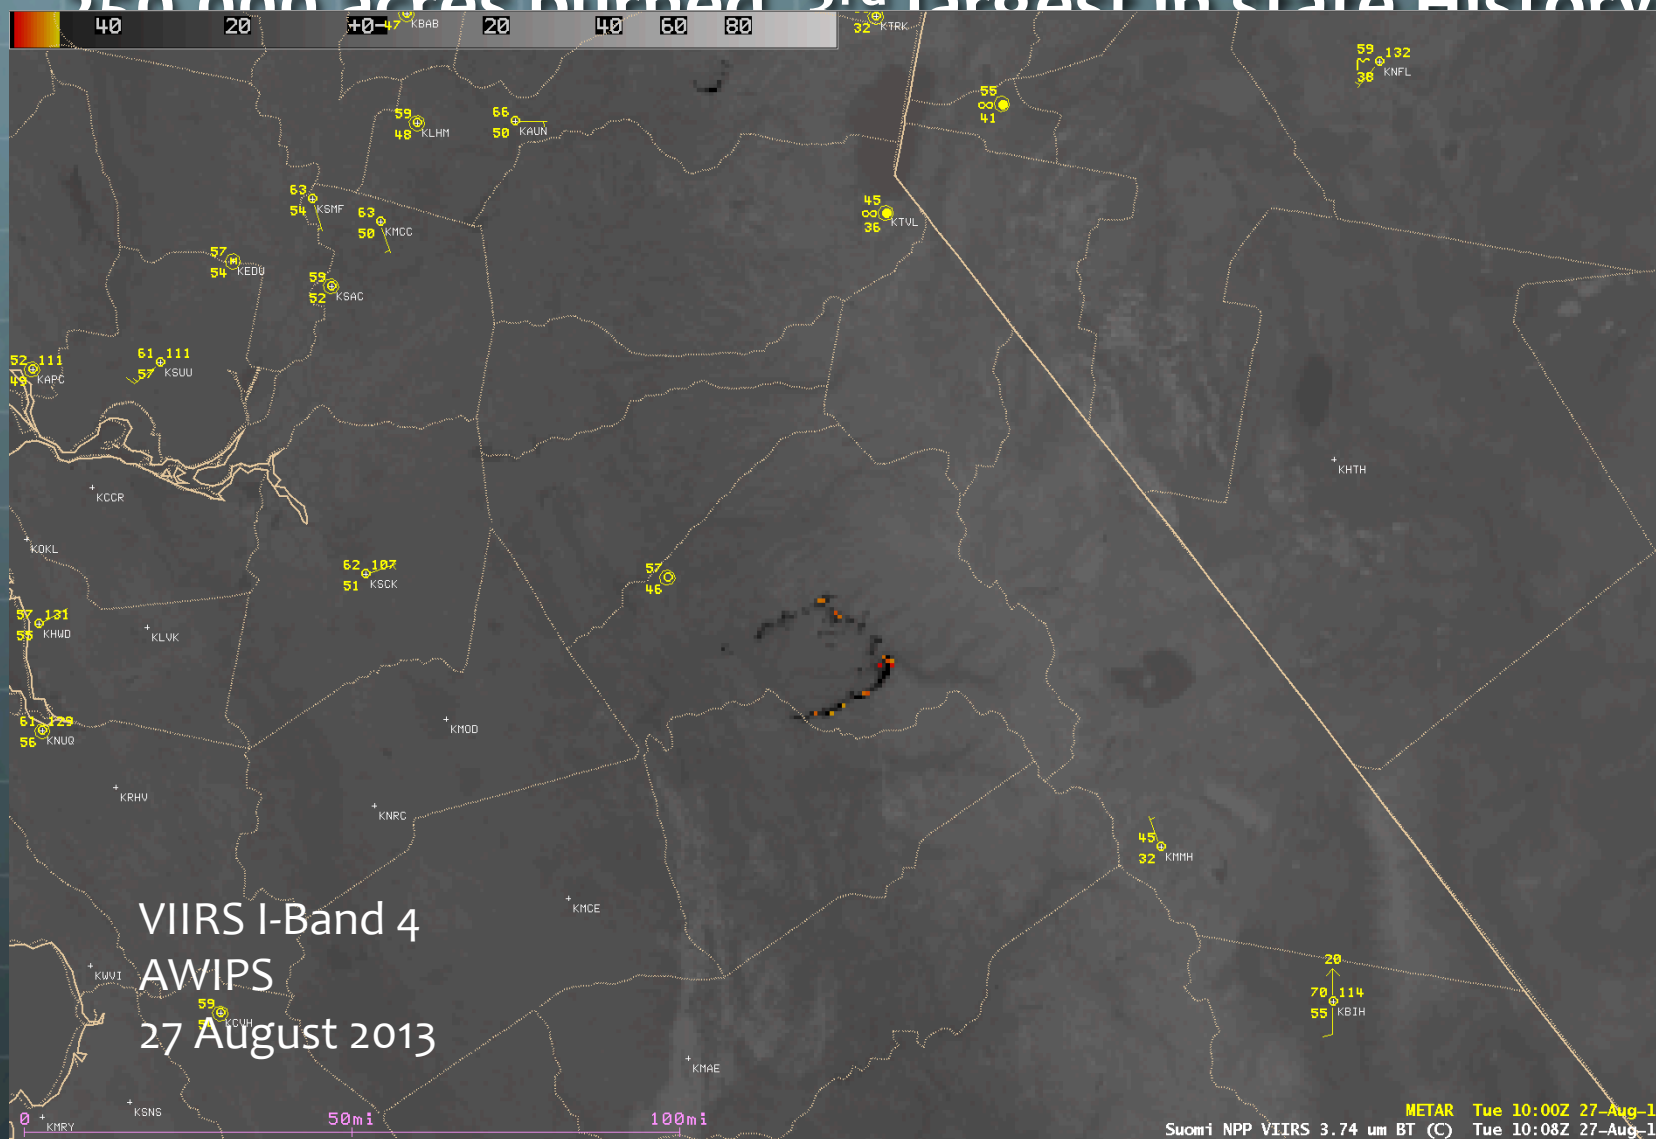

Hot Spot Detection

Rim Fire in California

250,000 acres burned, 2nd largest in state History

Hot Spot Detection

(Fire Product, Thermal anomalies)

- Based upon the difference in Temperature Sensitivity between 4 and 11 microns
- Contextual Fire Detection Algorithm
 - Infrared static Brightness Temperature thresholds
 - Dynamic thresholds compare pixel to surrounding background

How are Meteorological Satellites Used to Monitor Fires?

Pixel

$$B_4(T_4) = pB_4(T_{fire}) + (1-p)B_4(T_{bg})$$

$$B_{11}(T_{11}) = pB_{11}(T_{fire}) + (1-p)B_{11}(T_{bg})$$

Fire Output Parameters

1km resolution

- **fire_mask** 8 bit unsigned integer
 - 0 missing input data
 - 3 water
 - 4 cloud
 - 5 non-fire
 - 6 unknown
 - 7 fire (low confidence)
 - 8 fire (nominal confidence)
 - 9 fire (high confidence)
- Line and element of fire pixel
- Latitude and longitude of fire pixel
- Fire pixel confidence (one value for each fire detected per scene)

MODIS Emissive Bands

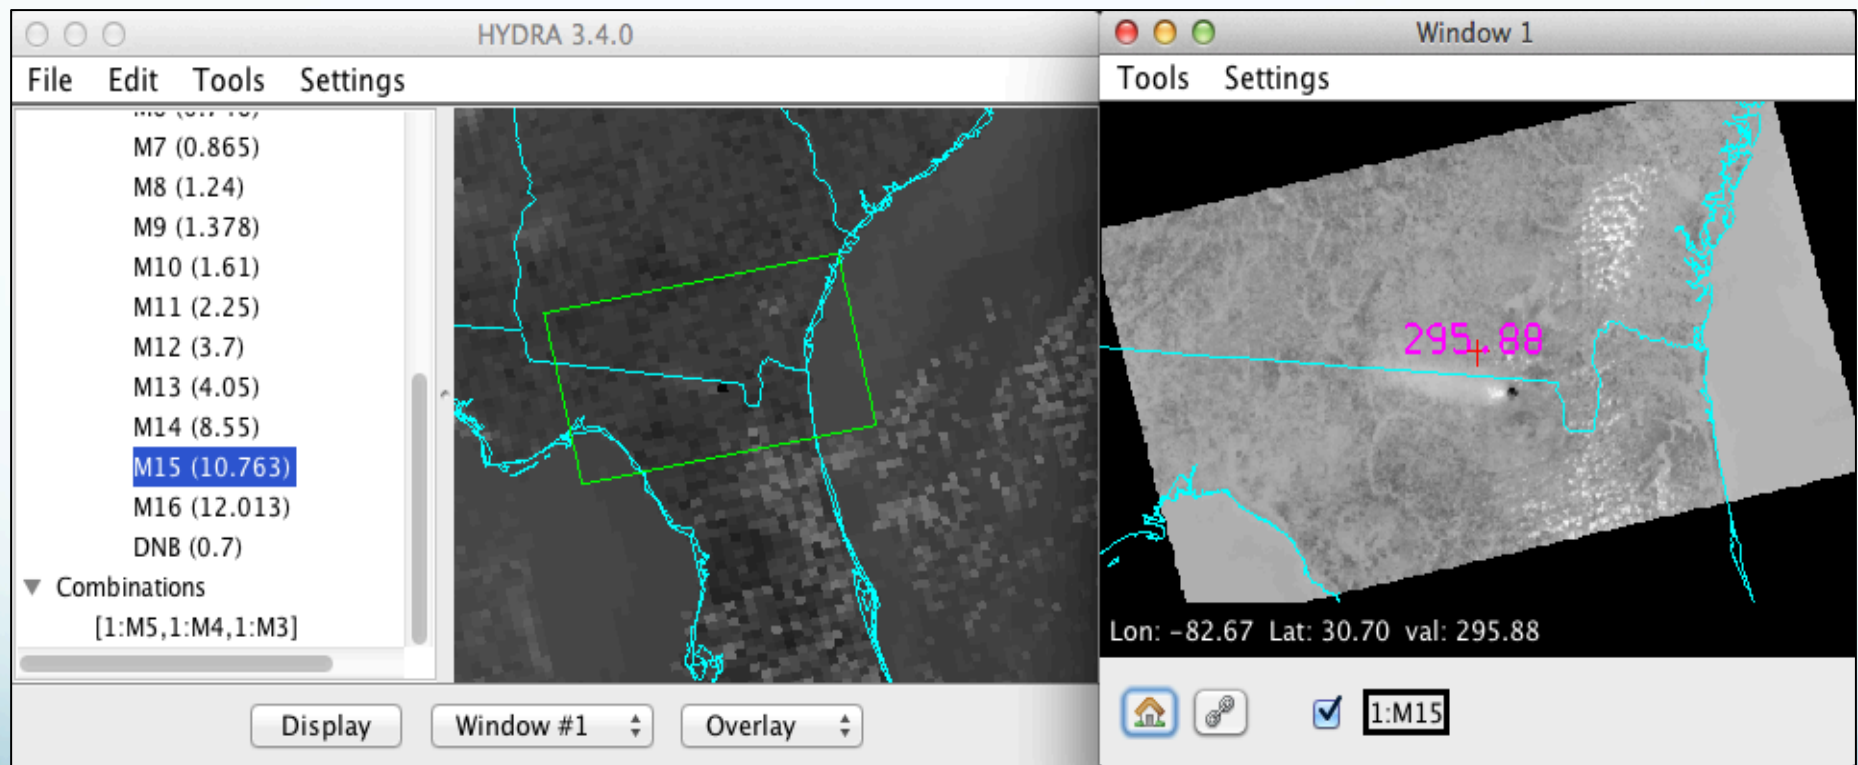

Primary Use	Band	Bandwidth ¹	Spectral Radiance ²	Required NE[delta]T(K) ⁴
Surface/Cloud Temperature	20	3.660 - 3.840	0.45(300K)	0.05
	21	3.929 - 3.989	2.38(335K)	2.00
	22	3.929 - 3.989	0.67(300K)	0.07
	23	4.020 - 4.080	0.79(300K)	0.07
Atmospheric Temperature	24	4.433 - 4.498	0.17(250K)	0.25
	25	4.482 - 4.549	0.59(275K)	0.25
Cirrus Clouds Water Vapor	26	1.360 - 1.390	6.00	150(SNR)
	27	6.535 - 6.895	1.16(240K)	0.25
	28	7.175 - 7.475	2.18(250K)	0.25
Cloud Properties	29	8.400 - 8.700	9.58(300K)	0.05
Ozone	30	9.580 - 9.880	3.69(250K)	0.25
Surface/Cloud Temperature	31	10.780 - 11.280	9.55(300K)	0.05
	32	11.770 - 12.270	8.94(300K)	0.05
Cloud Top Altitude	33	13.185 - 13.485	4.52(260K)	0.25
	34	13.485 - 13.785	3.76(250K)	0.25
	35	13.785 - 14.085	3.11(240K)	0.25
	36	14.085 - 14.385	2.08(220K)	0.35

Algorithm Description

- MODIS bands 21 and 22 (3.99 micron)
 - Band 22 saturates at 331 K
 - Band 21 “fire channel” saturates at ~ 500 K
 - 12 bit range broader – less sensitive
 - The calibration of B21 uses fixed calibration coefficients and not using the scan-by-scan onboard black body (more noise)
 - So use Band 22 unless it is saturated
- MODIS band 31 (11 micron)
 - Saturates at ~ 400 K for Terra
 - Saturates at ~ 340 K for Aqua

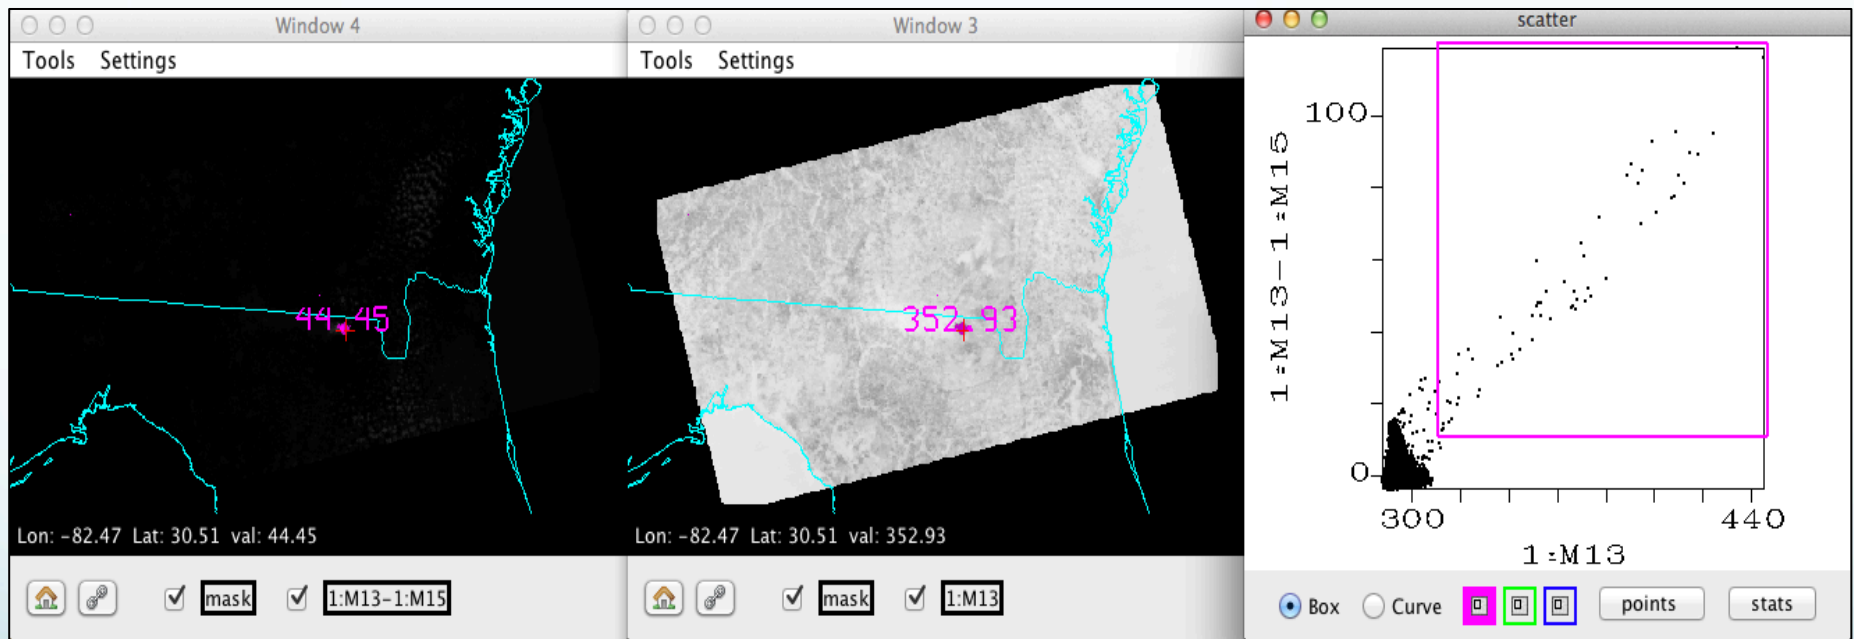

S-NPP Band 13 4.05 microns

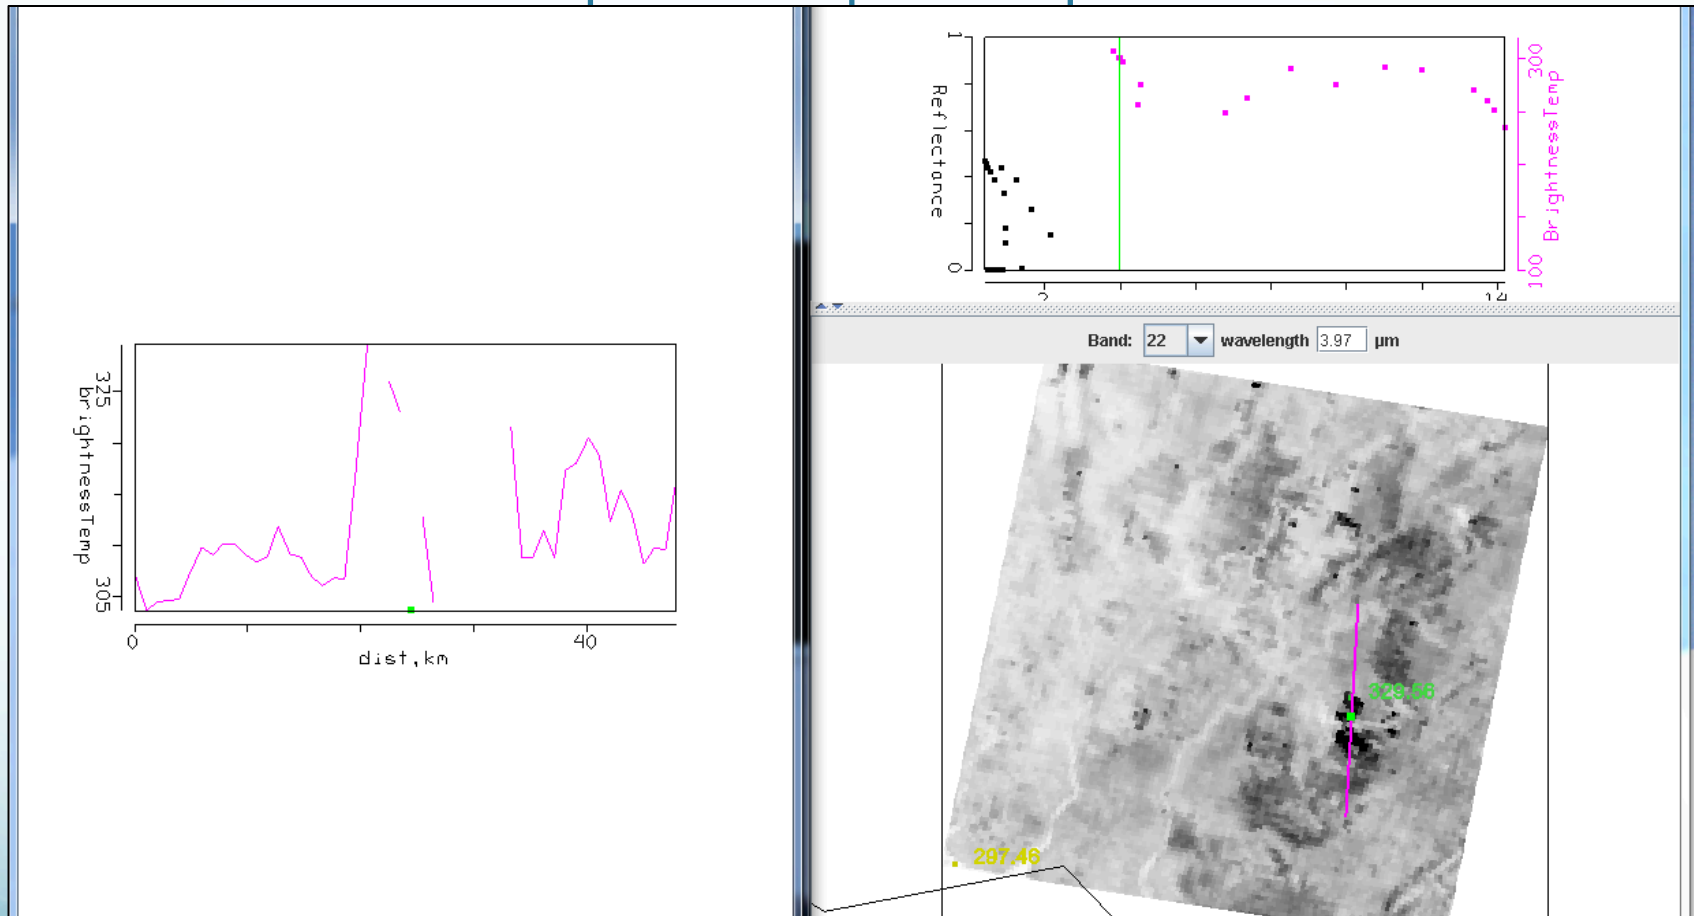

S-NPP IR Bands

11 August 2013

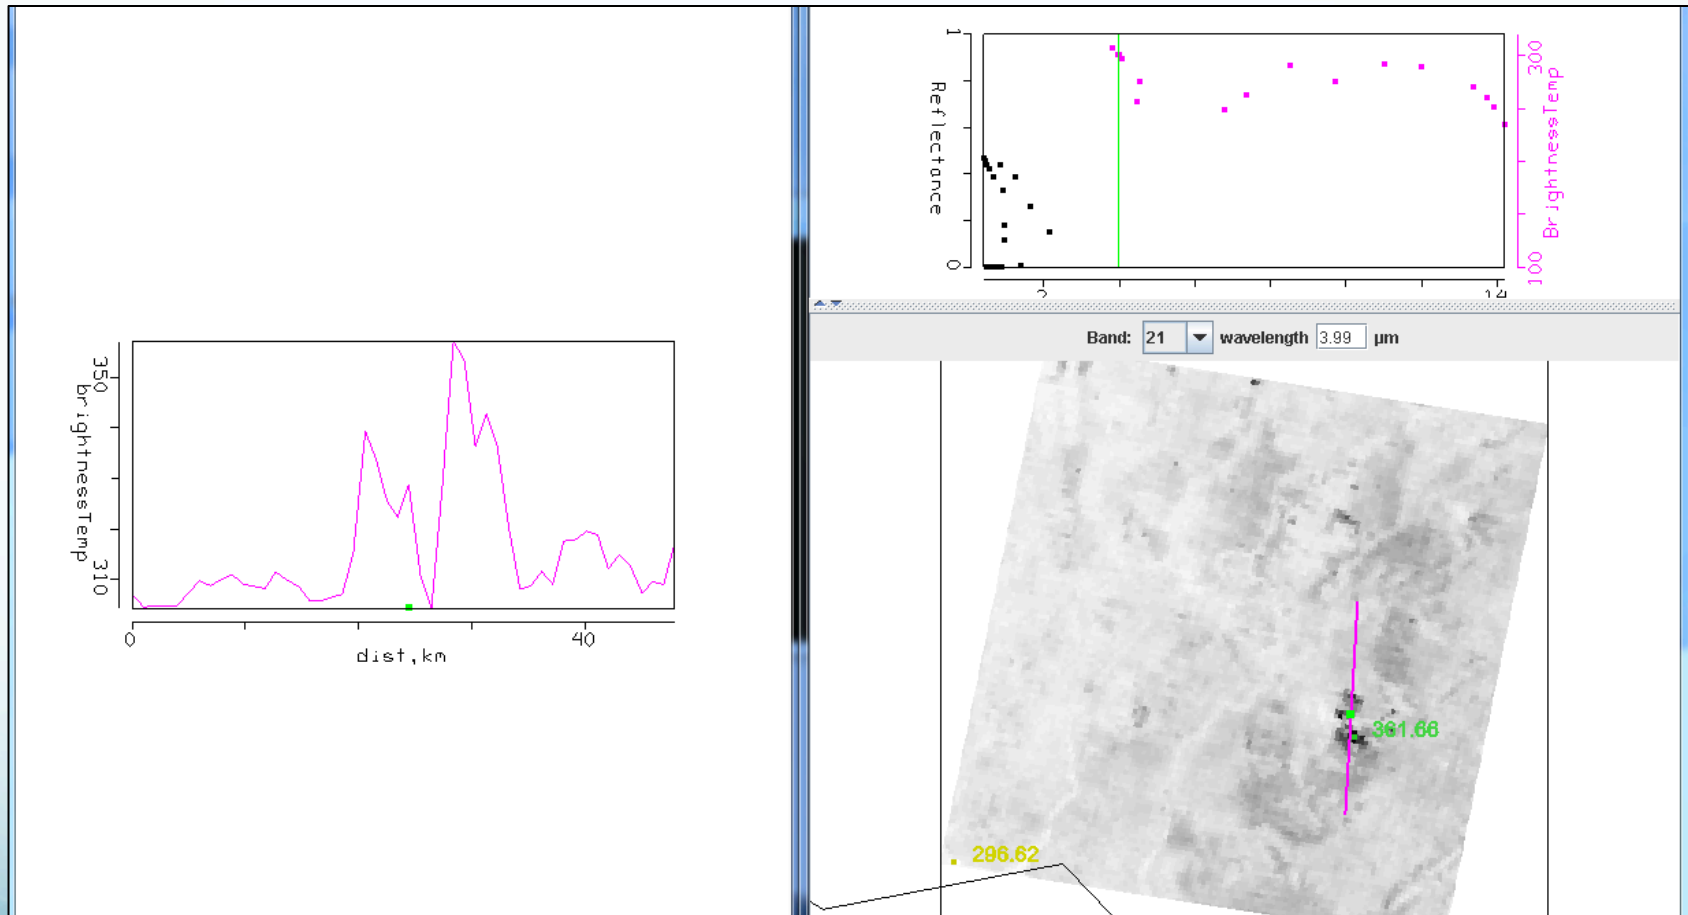

MODIS Terra Band 22 (3.99 micron)

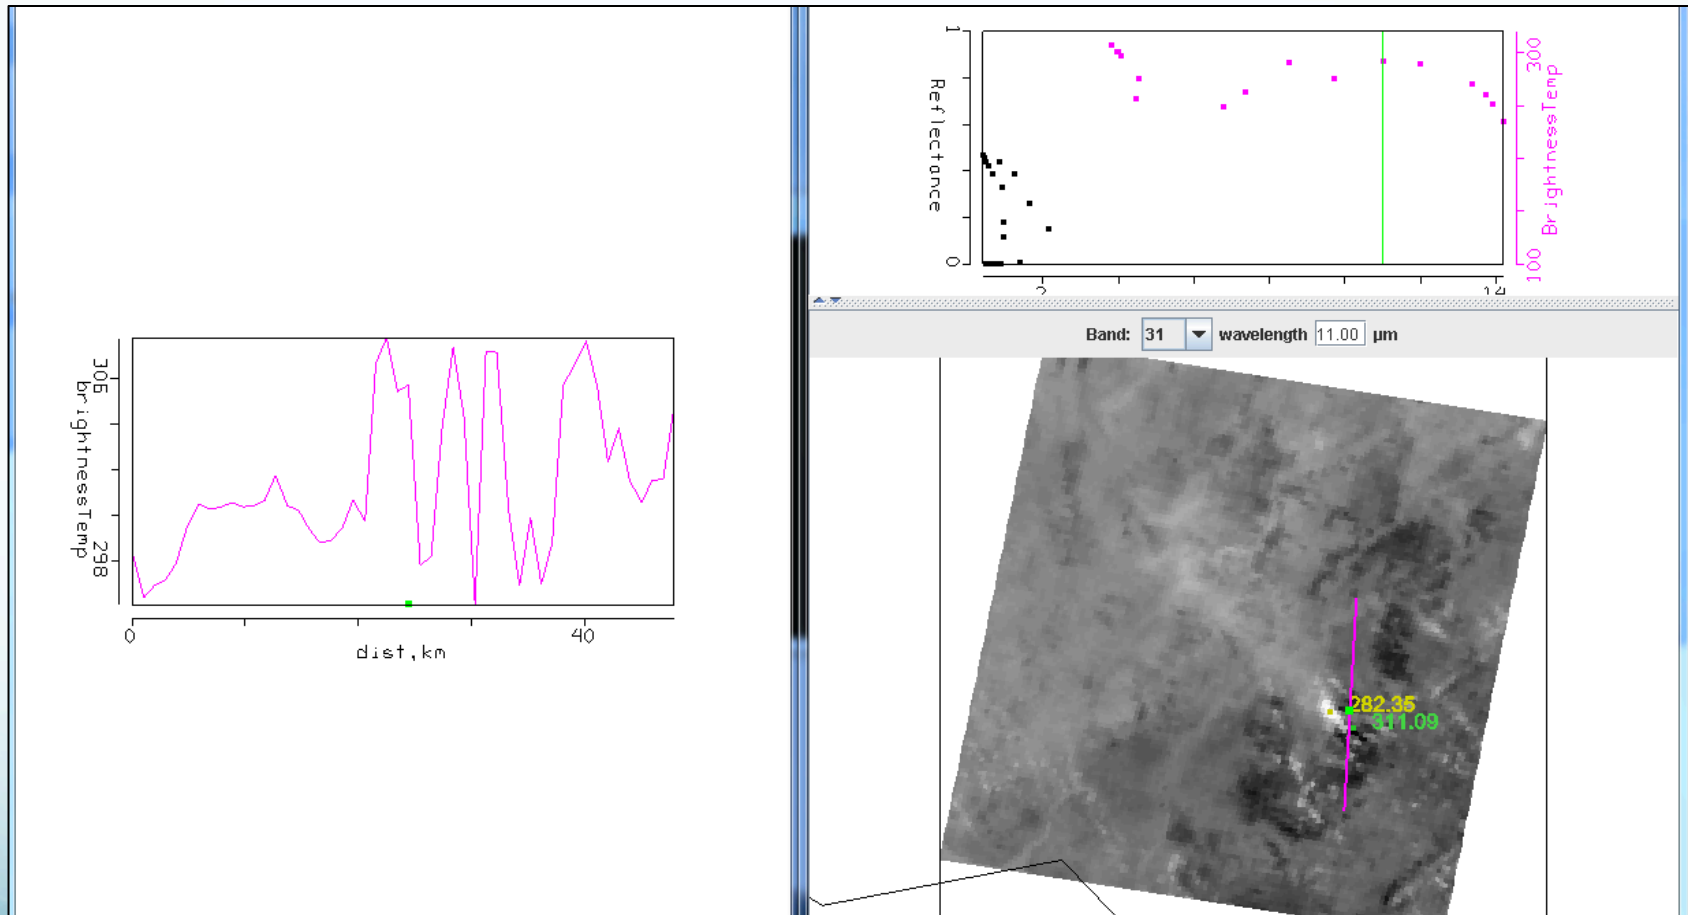

MODIS Terra Band 21 ($3.99\text{ }\mu\text{m}$) transect over fires

MODIS Terra Band 31 ($11\text{ }\mu\text{m}$) transect over fires

Algorithm Description (cont.)

- Potential Fire Pixel identified
 - $BT4 > 310 \text{ K}$ ($\sim 37 \text{ C}$)
 - $BT4-11 > 10 \text{ K}$
 - $.86 \text{ micron reflectance} < .3$
- Otherwise flagged as non-fire pixel

Screening Potential Fire Pixels

(1) $BT4 > 360 \text{ K } (\sim 87 \text{ C})$

Contextual Tests: Performed on as many as 21×21 box surrounding potential fire pixel to separate out from background

$$(2) \quad BT4 - 11 > \overline{BT4 - 11} + 3.5\delta_{BT4-11}$$

$$(3) \quad BT4 - 11 > \overline{BT4 - 11} + 6K$$

$$(4) \quad BT4 > \overline{BT4} + 3\delta_{BT4}$$

$$(5) \quad BT11 > \overline{BT11} + \delta_{BT11} - 4K$$

$$(6) \quad \delta'_4 > 5K$$

Where δ is the Mean Absolute Difference (MAD):

$$MAD = \frac{1}{N} \sum_i |x_i - \bar{x}|$$

Problem Areas

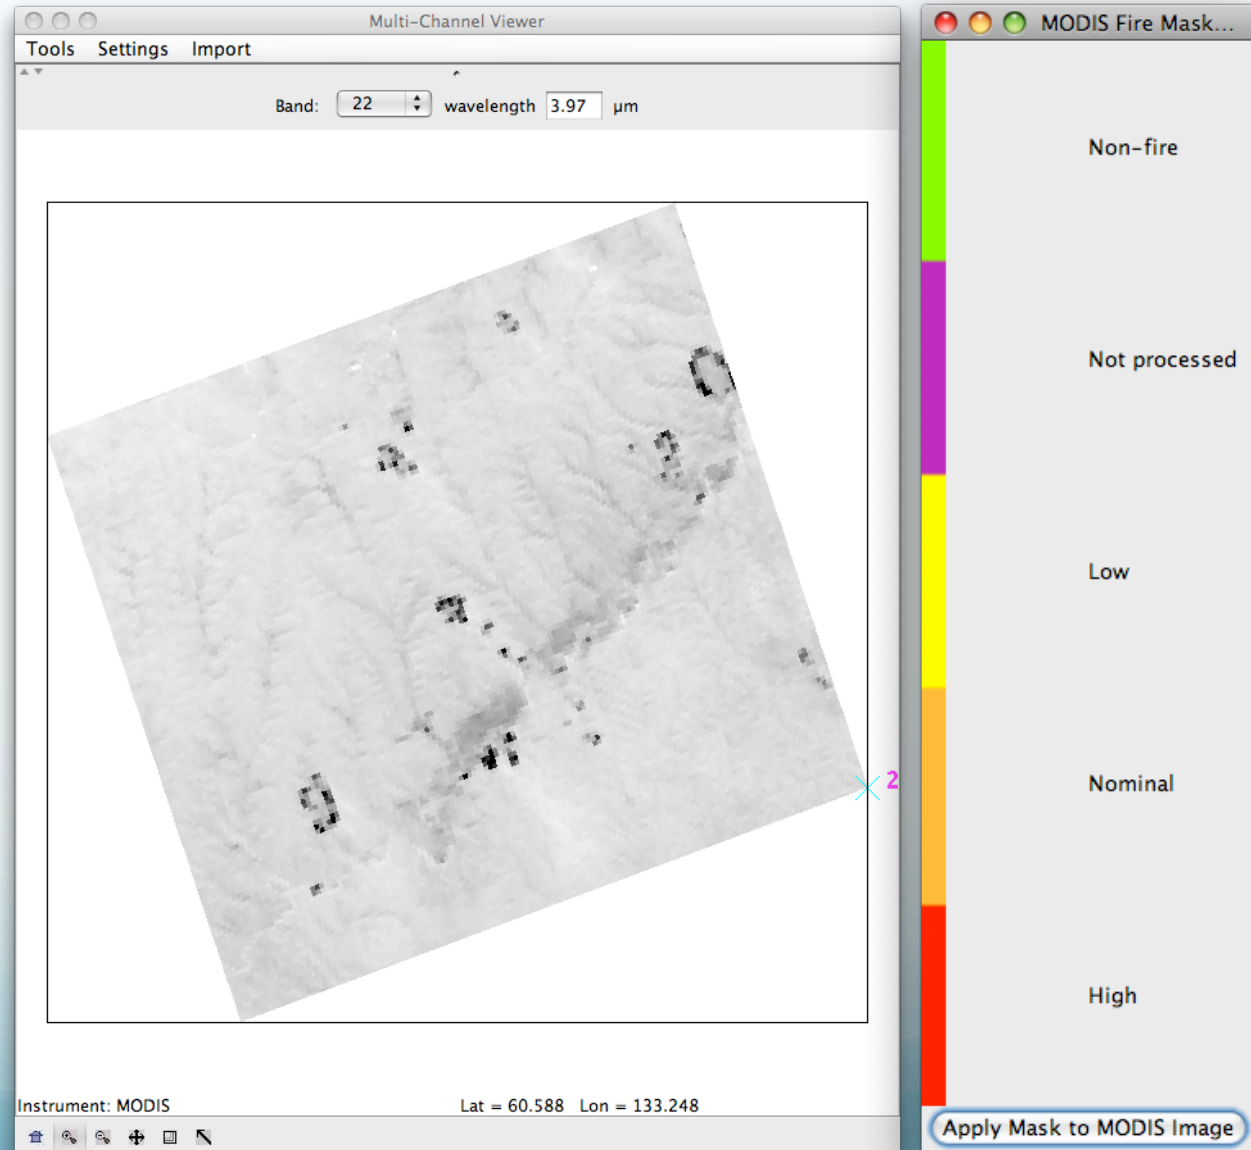

- **If there are many fires** – hard to get representative background temperature in max 21x21 pixel region
- **Sunlint** – Affects 4 micron band radiance
- **Transition areas** – contextual tests pick up boundaries
- **Coastal areas** – need really good geolocation so no mixed pixels are included
- **Clouds** – BT4-11 large over water and thick ice cloud

AREA FORECAST DISCUSSION

NATIONAL WEATHER SERVICE LUBBOCK TX

315 PM CDT MON APR 11 2011

.FIRE WEATHER...*GOES 3.9 MICRON AND MODIS/POES 3.7 MICRON SATELLITE IMAGES SHOW ONLY ONE FIRE START SO FAR THIS AFTERNOON ALONG THE KENT/SCURRY COUNTY LINE. GOOD NEWS IS THAT THEY ARE NOT SHOWING ANY LARGE FLARE-UPS ON THE SWENSON/STONEWALL AND KING COUNTY FIRE.* DECREASING WIND SPEEDS WILL ALSO HELP WITH ANY CONTINUED FIREFIGHTING EFFORTS THROUGH TONIGHT. BY LATE TOMORROW MORNING...CONDITIONS CONTINUE TO LOOK MARGINAL TOMORROW FOR MEETING RED FLAG CRITERIA...BUT SOUTH WIND OF 15 TO 25 MPH AND RH VALUES BETWEEN 10 TO 15 PERCENT WILL RESULT IN AT LEAST AN INCREASED FIRE DANGER OVER THE REGION. WILL HOLD ONTO THE FIRE WEATHER WATCH FOR ANOTHER COUPLE OF SHIFTS TO MAKE SURE THE FORECAST REMAINS CONSISTENT IN THE COMPUTER MODELS FOR TOMORROW.

- Due to wildfires, the NWS WFO in Lubbock, Texas, is using the AWIPS alerting system, GUARDIAN, to inform forecasters of each new MODIS and AVHRR shortwave IR image that arrives.
