Viewing Atmospheric Aerosols From the MODIS Satellite Sensor

Lorraine A. Remer

NASA/Goddard Space Flight Center

And the MODIS aerosol team: Y.J. Kaufman, D. Tanré
D.A. Chu, C. Ichoku, R. Kleidman, I. Koren, R. Levy,
R-R. Li, J.V. Martins, S. Mattoo

What are aerosols?

Definition: Aerosols are suspended droplets or particles that can scatter or absorb incoming sunlight

Scattering and Absorption of Light by Aerosols

$$\tau = (\sigma_{sp} + \sigma_{ap}) * L \quad \bar{\omega} = \sigma_{sp} / (\sigma_{sp} + \sigma_{ap})$$

The quantity L is called the density weighted path length. $\sigma_{ext(\lambda)} L$ is a measure of the cumulative depletion that the beam of radiation has experienced as a result of its passage through the layer and is often called the optical depth τ_λ .

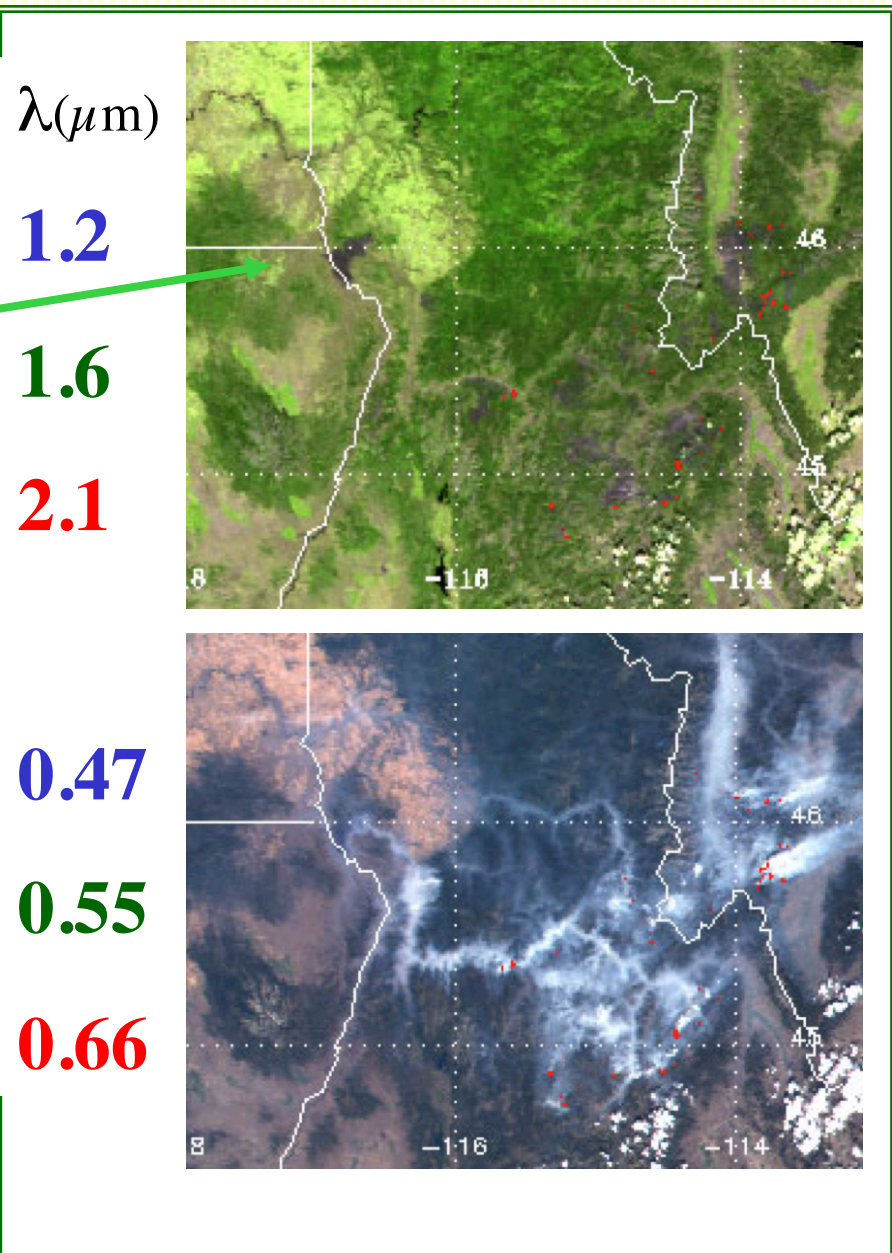

Wide Spectral Range makes land retrieval possible

- Mid-IR is used to observe the surface brightness

- Then aerosol is derived from estimated surface reflectance in the visible and actual reflectance

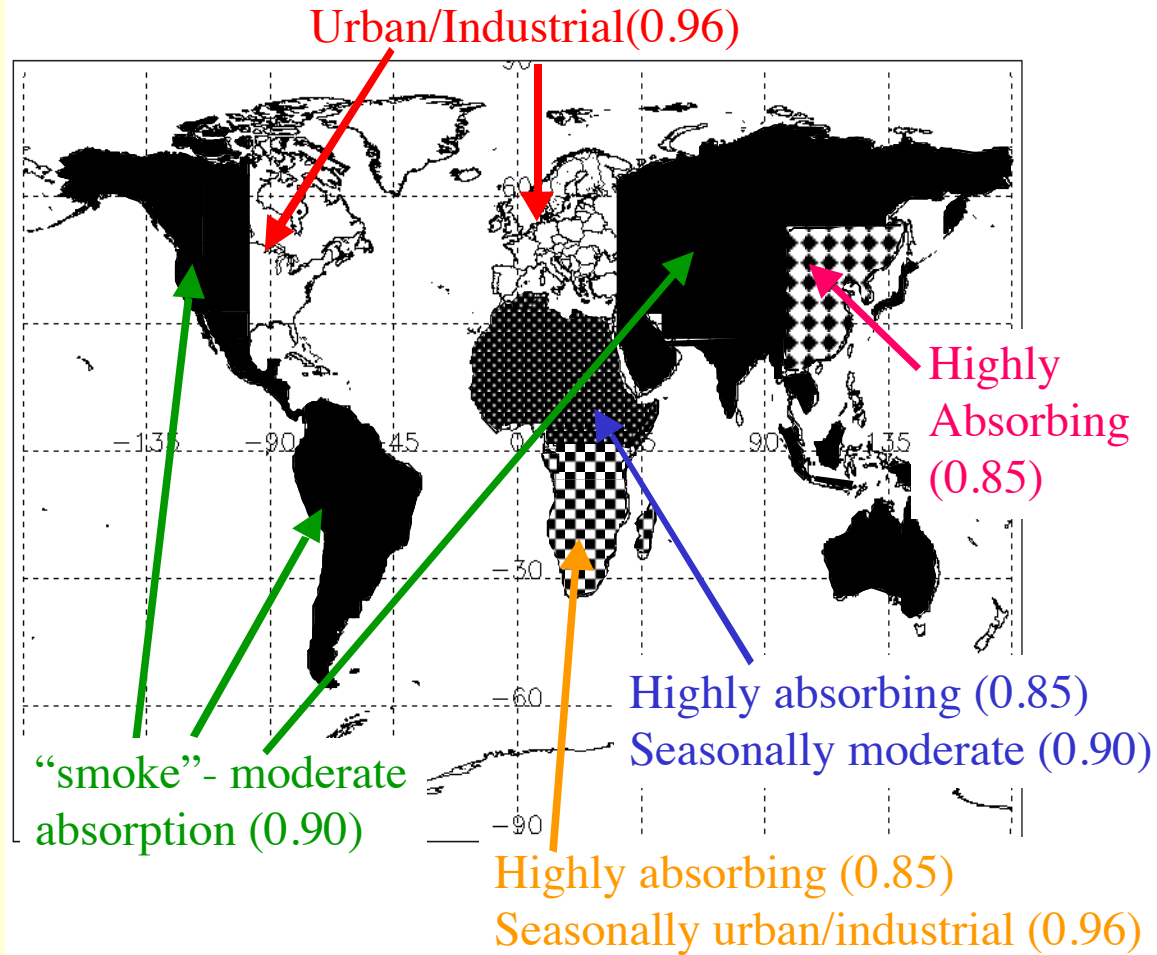

$$\tau_{0.66} \sim [\rho_{0.66}^* - 0.5\rho_{2.1}^*]$$

$$\tau_{0.47} \sim [\rho_{0.47}^* - 0.25\rho_{2.1}^*]$$

In this session the reason why dust detection by satellite is important is going to be explored interactively with the participants.

Published: 25 October 2011

The session will focus on the use of RGB products as a tool to retrieve relevant information from certain MSG channels. In particular, the DUST RGB is going to be thoroughly analysed, exploring the benefits of combining three channels in the infra-red region of the electromagnetic spectrum: IR8.7, IR10.8 and IR12.0. The principle of reverse absorption for dust with the IR10.8 and IR12.0 channels, as well as the differences in desert emissivity between IR10.8 and IR8.7, are key topics of the presentation.

Finally, other colours in DUST RGB images are explained to further exploit the product.

At the end of this lecture you should be able to:

- identify dust clouds in DUST RGB products;
- understand the reason why dust is magenta in the DUST RGB product;
- identify different magenta shades for exploring dust level in the DUST RGB product;
- get acquainted with the principle of reverse absorption with IR10.8 and IR12.0 channels;
- realise the impact of the desert emissivity and temperature in RGB products;
- learn what other colours in the DUST RGB product mean.

Pre-requisites: some knowledge in infra-red and visible satellite imagery and some experience in weather forecasting and/or air quality.

Why dust detection ?

UNCCD

United Nations
Convention to Combat Desertification

NEWS RELEASE

Disastrous Sand and Dust Storms Force Global Partnership

Buenos Aires, 24 September 2009. Experts from the United Nations Convention to Combat Desertification (UNCCD) and the World Meteorological Organization (WMO) have called for an immediate global response to the increasing number of sand and dust storms. Talks during the ninth session of the Conference of Parties (COP 9) of the UNCCD in Buenos Aires, Argentina, took account of the 4th Assessment Report of the Intergovernmental Panel on Climate Change (IPCC) warning that there will be an increased frequency of drought, especially in the dryland regions of the world.

Suspended particles in the atmosphere can affect global warming and have many deadly impacts on society. A high probability that meningitis in Africa and Valley Fever in the Americas is associated with sand and dust weather was reported. Meningitis in the sub-Saharan belt is one of the most feared epidemic diseases in Africa with high fatality rates and brain damage being common.

"Policy makers need to know the source of disease outbreaks, whether they are due to airborne or human transport, and to take actions to minimize risk to health and agriculture," WMO's Robert Stefanski said. "Present capabilities to provide effective climate services are far short of the needs in developing countries and must be improved." As much as 330,000 tons of sand fell on Beijing in a single night during spring conditions in 2006.

WMO is establishing a Sand and Dust Storm Warning Advisory and Assessment System to help countries receive early warnings on devastating sand and dust storms around the world.

A key expert on sand and dust storms, Yang Youlin of the UNCCD office in Bangkok, called for an enhanced ability of countries to deliver timely and quality forecasts of sand and dust storms. "Land degradation and sand encroachment in China has expanded to 3,436 square kilometers per year during the late 1990s and early 2000s."

In China alone, dust and sand storms originate from a total area of about 1 million sq. km. Rainfall patterns combined with efforts to control land degradation in Northern China, such as the 'Grain for Green Project', have helped to minimise sand and dust events in recent years.

In North America, the annual on-farm cost of wind erosion in the Prairie Provinces of Canada is estimated at USD \$250 million. "Long-term drought in Australia and its recent sand and dust storms highlight the risk to the world," said Stefanski.

Scientists meeting in Buenos Aires from 22-24 September during the UNCCD's COP 9 are also discussing over-grazing, over-cultivation and destruction of soil that accelerates wind erosion in dryland regions.

Ocean Color - SeaDAS

The screenshot shows the SeaDAS website interface. At the top, the browser address bar displays 'seadas.gsfc.nasa.gov'. Below the address bar is a navigation menu with folders for 'Personal', 'MODIS', 'DB', 'Wx', 'JPSS', and 'Technical'. The main header features a satellite image of the ocean with the text 'OceanColor SeaDAS' overlaid. A secondary navigation menu includes 'Missions', 'Data', 'Documents', 'Analyses', 'People', 'Forum', 'Services', and 'Links'. A large banner image shows a satellite in orbit over the ocean with the text 'SeaDAS' in large letters. Below the banner is a 'General Description' section. On the left of this section is a small screenshot of the SeaDAS software interface. To the right is a text block describing the system, and on the far right are three links: 'Features', 'Requirements', and 'Download'. At the bottom of the page, there are three more links: 'Supported Missions', 'User Support', and 'Other'.

SeaDAS

General Description

The SeaWIFS Data Analysis System (SeaDAS) is a comprehensive image analysis package for the processing, display, analysis, and quality control of ocean color data. The latest version (SeaDAS 7) is the result of a collaboration with the developers of ESA's BEAM software package. The core visualization package for SeaDAS 7 is based on the BEAM framework, with extensions that provide the functionality provided by previous versions of SeaDAS..

Table 1. Summary of Level-2 geophysical parameters and attributes

Parameter	Storage (bytes)	Approximate Range	Units	Long Name
Rrs_WWW	2	-0.015 – 0.115	sr ⁻¹	Remote sensing reflectance at WWW nm
chlor_a	4	0 – 100	mg m ⁻³	Chlorophyll Concentration, OC4 Algorithm
sst	2	-2 – 45	degrees C	Sea Surface Temperature

Atmospheric correction is critical for ocean color retrievals

- L_w is only 5-10% of signal reaching satellite: rest due to L_p
- L_p components: molecular (Rayleigh) & aerosols

MODIS Atmospheric Correction for Ocean Bands

Statement of the problem:

- Total radiance observed by the satellite is composed of 5-10% ocean signal and 90-95% atmosphere signal.
- The atmospheric and ocean surface scattering effects must be accurately modelled and removed.
- Desired parameter is normalized water leaving radiance (remote sensing reflectance) for MODIS bands 8, 9, 10, 11, 12, 13 (0.412, 0.443, 0.488, 0.531, 0.551, 0.667 microns)

harmful algal blooms

Gulf of Mexico Harmful Algal Bloom Bulletin
27 October 2005
National Ocean Service
National Environmental Satellite, Data, and Information Service
Last bulletin: October 24, 2005

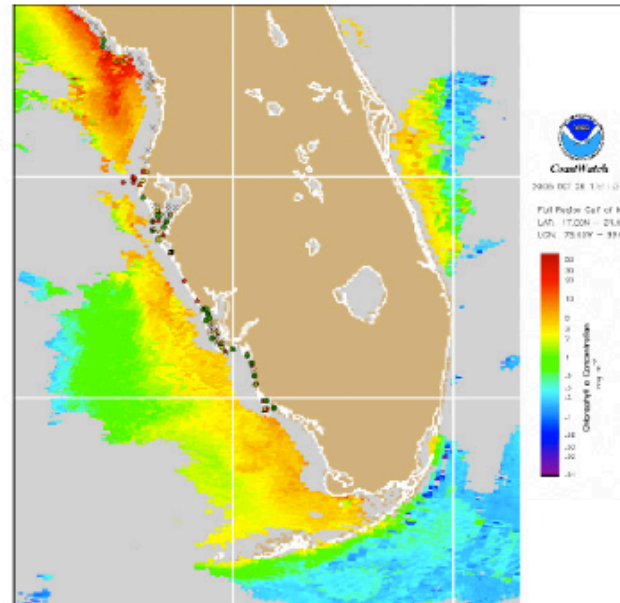

Conditions: Harmful algal blooms have been identified in Pinellas County, Dixie to Levy County and in very small patches from Manatee to Collier County in Florida. A secondary bloom has been identified in patches along Alabama and the Florida Panhandle. No impacts are expected along the coast from Pinellas to Collier County or from Dixie to Levy County today through Sunday. Patchy very low to low impacts are possible from Wakulla to Okaloosa County, FL and Baldwin to Mobile County, AL today through Sunday. Dead fish have been reported in Bay and Okaloosa Counties over the past few days. Dead fish smell, while unpleasant, does not produce the same respiratory irritation as red tide.

Analysis: The harmful algal bloom continues to dissipate along the SW Florida coastline; however very small remnant populations of *K. brevis* may still be present in patches from Pinellas to Collier County. Low *K. brevis* concentrations remain offshore of Bunces Pass in southern Pinellas County. Previous low *K. brevis* concentrations in Sarasota County have decreased to background levels (FWRI 10/20-26). Chlorophyll levels are elevated all along the Florida coast due to resuspension produced by Hurricane Wilma; thus bloom extent analysis is limited. Results of a wind transport model indicate possible bloom movement 20-30km southward since October 24. No recent samples have been reported from Levy to Dixie Counties. Sampling is recommended. Persistent northeasterlies will minimize coastal impacts through Sunday. Continual dissipation of the bloom is expected. Reports of discolored water are likely.

Fisher, Bronder

Please note the following restrictions on all SeaWiFS imagery derived from CoastWatch:

1. These data are restricted to civil marine applications only; i.e. federal, state, and local government use/distribution is permitted.
2. Distribution for military, or commercial purposes is NOT permitted.
3. There are restrictions on Internet/Web/public posting of these data.
4. Image products may be published in newspapers. Any other publishing arrangements must receive OrbImage approval via the CoastWatch Program.

Chlorophyll concentration from satellite with HAB areas shown by red polygon(s). Cell concentration sampling data from October 19, 2005 shown as red squares (high), red triangles (medium), red diamonds (low b), red circles (low a), orange circles (very low b), yellow circles (very low a), green circles (present), and black "X" (not present).

Wind speed and direction are averaged over 12 hours from measurements made on buoys. Length of line indicates speed; angle indicates direction. Red indicates that the wind direction favors upwelling near the coast. Values to the left of the dotted vertical line are measured values; values to the right are forecasts.

SW Florida: Moderate (10-15kts, 5-8m/s) northeasterly winds today will continue through Sunday; strengthening up to 20kts (10m/s) Saturday and Sunday.
