The Cross-track Infrared Sounder (CrIS) instrument is now flying onboard NPP and NOAA20 platforms. At the Canadian Meteorological Centre (CMC) NPP and NOAA20 CrIS observations are assimilated operationally since December 2015 and July 2019 respectively. Observation system experiments were performed using a simplified assimilation system:

- Low resolution forecast model (39 km resolution instead of 25 km operationally)
- Low resolution ensembles (66 km resolution instead of 39 km)
- No coupling with the EnKF system (offline ensemble members used for all experiments)

Observations types

Conventional Observations:
- Radiosondes
- Aircraft reports
- Atmospheric motion vectors (geostationary + polar)
- Scatterometer winds
- GPS radio occultations
- Ground based GPS

Microwave radiances:
- AMSU-A (NOAA15, NOAA18, NOAA19, AQUA, METOP-1, METOP-2) 11 channels
- MHS (NOAA19, METOP-1, METOP-2) 4 channels
- ATMS (NPP, NOAA20) 17 channels
- SSSM-S (DMSP17, DMSP18) 7 channels

Infrared radiances:
- AIRS (AQUA) 139 channels
- IASI (METOP-1, METOP-2) 142 channels
- CrIS FSR (NOAA20) (103 channels)
- CSR (GOES15, GOES16, METEOSAT8, METEOSAT11, HIMAWARI-8) water vapour channels

Assimilation experiments

RESULTS

From 20190601 to 20190809

Main findings:
- Impact of CrIS NOAA20 assimilation on top of all other assimilated observations appears weak.
- Impact of CrIS NOAA20 assimilation on top of the No rad experiment is significant and reveals the intrinsic value of the observations.
- Most of the impact comes from temperature sounding channels
- Impact of CrIS S-NPP on top of CrIS NOAA20 is moderate. It could be underestimated due to the data gaps for S-NPP during the experiments.

Future work and research avenues

In the near future, the simplified assimilation setup used in that poster will be used to answer the following questions:
- Can cloud detection be improved using the VIIRS cloud mask?
- Is there a benefit to assimilate more channels especially in the CO2 band?
- Can we improve our observations errors (see Joël Bédard talk)?
